(a)
State A — intact
primary circuit
health
Candidate usefulness: E_A(h)
State B — perturbed context
primary circuit
health
Candidate usefulness: E_B(h)
(b)
Δ_h = E_B(h) − E_A(h)
Detection: did usefulness change?
FALI: what accounts for the change?
(c)
T
target score(s)
R
rival scores
O
other valid scores
V
value content
C
surrounding context
φ_T + φ_R + φ_O + φ_V + φ_C = Δ_h
Controlled counterfactual accounting; not five unique natural pathways.
