(a)
Intact state
primary
head h
$E_A(h)$
Perturbed state
primary
head h
$E_B(h)$
(b)
$\Delta_h = E_B(h) - E_A(h)$
Detection: did causal usefulness change?
FALI: what accounts for that change?
(c)
T
target score(s)
R
rival scores
O
other valid scores
V
value content
C
surrounding context
$\phi_T + \phi_R + \phi_O + \phi_V + \phi_C = \Delta_h$
